Title : Continuous Fermentation

Orig Pub : Techn. przem. spozywcz., 1956, Vol 5, No 7, 231-233

Abstract : The advantages and drawbacks of batch, semicontinuous, and continuous fermentation of the wort syrup are discussed. Continuous fermentation is generally recognized as giving the highest yield of alcohol, the best utilization of equipment, and the greatest efficiency of operation under conditions of improved process quality control. The yield of alcohol per m³ of yeast and fermentation unit is as follows: for batch operation, 34-35; for semicontinuous operation, 49; for continuous operation, over 100 liters per day. The increased yield of alcohol obtained by the continuous fermenta-

Abs Jour : Ref Zhur - Khimiya, No 3, 1957, No 10220

Abstract : tation process is achieved by the more intensive fermentation of the sugars and the reduction of the losses incurred in the formation of the yeast colonies. A two-stream continuous fermentation process is recommended, using a 13° concentration for the yeast wort and a concentration of 32-34° for the strong wort. The yeast wort is prepared by adding concentrated H_2SO_4 to a 20-fold volume of water in such a way as to adjust the acidity of the final solution to 1.5°; next, the elementary substances (2 kg superphosphate and 1 kg $(NH_4)_2SO_4$ per 100 liters alcohol) are added, and the solution is adjusted to a wort concentration of 12-14° by heating and by the addition of water from a fractionating column.

I-29

Abs Jbur : Ref Zhur - Khimiya, No 3, 1957, No 10220

Abstract : The ready yeasts are fed into one or two and sometimes even three fermentation vats together with the strong wort. A fermentation battery consists of two yeast vats and eight fermentation vats; the sugar content (numbers in parentheses) and alcohol content in the vats are adjusted as follows:
No 1 yeast vat, (0), 2.6; No 2 yeast vat, (0), 4.5; fermentation vat No 1, (2.27) 6/3; No 2, (1.81), 69; No 3, (4.62), 6.7; No 4, (2.93), 8.0; No 5, (1.60), 8.8; No 6, (1.04), 9.2; No 7, (0.82), 9.6; and No 8, (0.58), 9.7. The use of a mixture of several strengths of yeast is recommended; the yeasts will distribute themselves over the various vats during fermentation according to their characteristics and the conditions prevailing in the medium. The CO₂ evolved in the fermentation is passed successively through all the vats

Abs Jour : Ref Zhur - Khimiya, No 3, 1957, No 10220

Abstract : in the battery; thus the foam formed in the first vats is quenched in the last vats, in which the fermentation proceeds more slowly. All the fermentation equipment is hermetically sealed. The overflow of the fermented wort from one vat to the next proceeds through connecting pipes leading from the bottom of one tank to a height 50 cm below the top of the next tank. The vats are washed and sterilized infrequently.

Title: The Method of Continuous Alcoholic Fermentation of Molasses

Original

Publication: Przem. spozywczy, 1956, 10, No 4, 165-168

Abstract: Description of the methods, practiced in Poland, of intermittent, semi-continuous fermentation of molasses mash, and also of the continuous fermentation method (CFM) carried out at one of the molasses-alcohol plants. The fermentation battery of CFM consists of 2 yeast- and 8 fermentation vats which are cylindrical with a tapering bottom. Yeast vats are above fermentation vats which are installed all on the same level and are connected in consecutive order with the fermenting liquor flowing from the bottom of each vat to the upper part of the next. Characteristic features of CFM are: use of a two-current

Card 1/2

Poland/Chemical Technology. Chemical Products and Their Application -- Fermentation industry, I-27

Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 6474

Abstract: system of addition of sterilized 13% wort into the yeast vats and 33% wort into the fermentation vats; blowing of the yeast slurry with air at a rate of 1.5 m³/m³; acidification of the yeast wort with sulfuric acid to 1.5°; addition to the yeast wort of superphosphate -- 2 kg/100 decaliter and (NH₄)₂SO₄ 1 kg/100 decaliter of anhydrous alcohol; maintaining the amount of yeast cells at a level of 180 million/ml in the yeast vats and above 70 million/ml in the fermentation vats; fermentation temperature ~25° in the yeast vats and not below 30° in the fermentation vats; concentration of the fermenting slurry in the yeast vats 4.5%, and in the fermentation vats, consecutively, 7-8.5-10-9-7.5-6.5-6.2 and 6%; alcohol content by numerical order of battery vats 2.6-4.5-6.3-6.9-6.7-8-8.8-9.2-9.6 and 9.7%; mature fermentation liquor contains about 0.5% unfermented sugar. Plant scale experiments of the use of CFM have revealed: yield of alcohol is not lower than that obtained by the old fermentation methods; increase in alcohol recovery per 1 m³ by 60-95%; reduction in labor by 70%; decrease in corrosion of metal parts of vats; savings in steam for vat sterilization. Nothing is said concerning the necessity of periodical washing and disinfection of the battery vats. A layout of the unit is included.

ABSTRACT: An Author Certificate has been issued for a digital scanner consisting of a lens at one end and a formation of concentric circles at the other end. Coherent light passing through fiber elements strikes the circles in such a way that the largest circle receives the total light input from the whole surface area while the inner circles receive proportionally smaller amounts. A slotted shutter rotates behind the circles, admitting light only from a small area of a circle. A lens

"Differentiated Care for Patients in Internal Medicine."

Prague, Casopis Lekaru Českych, Vol 105, No 26, 24 June 66, pp
706 - 707

Abstract: The concentration of critically ill patients in special rooms is discussed. It is suggested that a room with 5 to 10 cubicles be placed under the constant care of one doctor and 10 nurses; special equipment required in the care of critically sick patients is described, and this should be constantly available. The patients feel reassured by the constant presence of the medical personnel, and no adverse reactions, due to patients worry over their condition, were observed. No references.

402. A New Neurological Sign. (Nowy znak oponowo-żebrowy (objaw karkowo-paliowy))
E. HERMAN. *Podatki Tropikalni Lekarskie*. Drz. let.
4, 632, May 23, 1949. 2 figs.

In this preliminary communication the author describes a new sign which is frequently seen in tuberculous meningitis: passive flexion of the head elicits an extreme response of the big toe, accompanied occasionally by fanning and plantar flexion of the toes. This sign is often present without Babinski's sign, although in some cases they may both occur together. When the patient is examined, both legs must be maintained in extension. The sign may be present unilaterally or bilaterally. It indicates a meningo-cerebral lesion, and in this respect differs from the well-known purely meningial signs, such as Kernig's and Brudzinski's. In tuberculous meningitis treated with streptomycin the sign may disappear when the patient's condition improves, but recurs during a relapse.

Psychiat. polska 1951, 1/4 (259-270) Tables 1 Eight cases of myasthenia were treated by bilateral removal of adventitia from the carotid sinus. In 2 cases there were very good results, in 4 distinct improvement, in 2 slight improvement. Follow up 5-31 mth. The most serious forms of myasthenia give the best results. Every case of myasthenia resistant to conservative treatment should be treated by this method. Experimental work is giving support for this kind of treatment. Thymectomy is rejected as being too dangerous and uncertain an operative method in myasthenia.

Description of 6 patients, 4 males and 2 females with progressive muscle atrophy in combination with clinical pictures suggestive of abortive or atypical Cushing syndromes. The biochemical abnormalities were often not of the type found in Cushing's disease. In one case at autopsy an adenoma of the thyroid gland was found with moderate hypertrophy of the adrenal cortex and increase of the eosinophil (?) cells of the hypophysis. The author suggests a diencephalic genesis of the muscle atrophy and the endocrine disturbances.

Absorption of intracutaneously injected isotonic solutions of calcium salts. Géza Hetényi and Károly Hermina. *Magyar Orvosi Akad. Sz. Művei*, 41, 51-64 (in English, 1940).—The area of infiltration of intracutaneous isotonic CaCl soln. disappears within 2½-3½ hrs., the time of absorption by individuals showing a notable constancy. The rate of absorption is lowered after intravenous injection of 10 cc. of 10% aqu. CaCl₂ by parathyroid ext., and by alkalies; it is increased by acids by novocain diuresis, and by a low-Ca diet.

Title : Albedo of Non-Homogeneous One-Group Neutron Currents
(RS 11).

Orig Pub : Repts. "J. Stefan" Inst., 1957, 4, 43-55

Abstract : Use is made of one-group diffusion theory for the study of the albedo operator of a layer and of a hollow cylinder (non-multiplying) in the case of an inhomogeneous neutron current. Using double Fourier transformations (direct and inverse) the authors obtain an expression relating the outgoing neutron current (J_{out}) and the incoming one (J_{in}) for a layer of thickness d . Since the calculations are in general very complicated, several particular examples are considered. For a "thin jet"

of an incoming neutron stream (differing from zero only along one axis), the authors calculate the zero (M_0) and second (M_2) moments of the distribution of J_{out} . Curves of $M_0(d)$ (reflection of homogeneous incoming current) and $\sqrt{M_2(d)/M_0(d)}$ (where $M_2(d)/M_0(d)$ is the mean square of the distance at which the neutron reverses itself) are given for H_2O , Be, C, and D_2O . The following cases are considered: J_{in} differing from zero only at the origin (expressions are obtained for M_0 , M_2 and M_4), and almost homogeneous J_{in} . The calculations of J_{out} become considerably easier if J_{in} satisfy the wave equation. An investigation is made of a hollow cylinder (inside radius R_1 , outside radius R_2). By way of a numerical example a "thin jet" is considered (J_{in} differs from zero only along the generatrix of the cylinder).

Title : Transparency of a Plane Slab of Non-Multiplying Material
for Time Dependent Non-Homogeneous Currents (RS 12).

Orig Pub : Repts. "J. Stefan" Inst., 1957, 4, 57-65

Abstract : A relation is derived between the neutron current entering from one side into a slab of thickness d ($J_{in}(x, 0, z, t) = J_{in}(0)$) and the neutron current leaving the other side ($J_{out}(x, d, z, t) = J_{out}(d)$). The problem is solved by means of one-group diffusion theory. First the authors consider the time independent J_{in} . The relation between $J_{in}(0)$ and $J_{out}(d)$ is obtained with the aid of double Fourier transformations (direct and reverse). A series of particular examples is considered:

slowly varying J_{in} ; J_{in} that satisfies the wave equation $J_{in} = \delta(x)$. $\delta(z)$ ("thin jet" of incoming current). Equations are derived for the moments of the distribution of $J_{out}(d)$ in the case of a "thin jet". A graph is given for $M_0(d)$ (the passage of a homogeneous thermal neutron current at $J_{in}(0) = \text{const}$) for D_2O , C, and H_2O . An approximation formula is derived for J_{out} in thick slabs ($d \gg L$) from which the curve $J_{out}(d)$ is calculated for C and H_2O . An expression is obtained for J_{out} in general form for the case of a time-dependent incoming neutron current. For a step-like change in J_{in} in time, the authors calculate the delay time t_D (the time that J_{out} goes to 50% of its final value) and the rise time t_R (from 10 to 90% of the final value of J_{out}) for $d \gg L$. The value of J_{out} is calculated for oscillating J_{in} .

Conventional Titrimetric Indicators.
Orig. Pub. : Comun. Acad. RPR, 1958, 8, No 4, 371-374

Abstract : It was found that the ruby-red anthocyanidin contained in the scales of the fruit of sorghum, which the authors designate as "rubisorghuidine" (I), is suitable for use as an indicator in acidimetric and alkalinometric titrations. I was isolated by extraction with methanol in a Soxhlet apparatus; final purification of I from admixtures was effected by chromatography in a CaCO_3 column. I is a powder, MP 171-172°, odorless and tasteless, readily soluble in CH_3OH , $\text{C}_2\text{H}_5\text{OH}$, amyl-, butyl-, and isopropyl alcohol, ethyl acetate, acetone, glycerol, diethylene glycol, and practically insoluble in water, benzene, CHCl_3 , ethyl- and petroleum ether, CCl_4 , CS_2 , and hexane. "The Organization of Cooperation in Broiler Production between the Poultry Center in Pozarevac and Private Farmers."

Belgrade, Veterinarski Glasnik, Vol 17, No 9, 1963, pp 771-779.

Abstract: Advance preparations for the cooperative production of broiler chickens in the Pozarevac area involved the supply of one-day chicks to private farmers with appropriate facilities for 70 days in 1962. The farmers were to handle the chicks according to instructions from the poultry center. Mortality among the 5777 chicks sent out was 5.7 percent, and the average weight of the chickens remaining after 70 days was 1.036 kilograms. Problems considered in connection with an expanded program for 1963 included the proper selection of farmers (those known as good tenders of livestock, with facilities for 1000 chicks at a time, and enough workers in the family to perform regular jobs with the chickens), the technological process of production (a combination of the battery system and the floor system is desirable), feed (the center will supply three types of mixtures), the production of one-day chicks (from crossing White Rock hens with White Cornish roosters), and relations between the center and the farmers (regulated in detail by individual contract). The article concludes with calculations of costs and income.

AUTHOR: Herman, Marian

TITLE: Determining the operating parameters of a three-level ruby maser with cavity resonator

PERIODICAL: Postępy Fizyki, v. 14, no. 1, 1963, 85-100

TEXT: A review article. The maser action is explained in general terms using a semiclassical picture of energy distribution in a system of atoms, and the electron-spin properties of ruby ($\text{Al}_2\text{O}_3:\text{Cr}$) crystals are discussed considering the requirements set upon the pumping frequency for a crystalline maser and the external magnetic field H_0 for the case of a three-level arrangement. The effect of harmonic spin-coupling and cross-relaxation are briefly discussed in connection with the four-level maser. Following A.A. Vuylsteke (Elements of maser theory, D. Van Nostrand Co. Inc., New York, 1960) the method is outlined of calculating the operating parameters of a three-level ruby maser, i.e. the dependence of the external magnetic field H_0 and the angle θ between H_0 and the direction

Card 1/2

Determining the operating ...

P/047/63/014/001/002/003
D256/D308

of the crystalline axis in ruby upon the frequency of pumping and the signal frequency. The spin Hamiltonian is regarded as a perturbation of the degenerated levels of chromium in the crystalline lattice and a second-order perturbation calculation is applied to the degenerated levels. The matrix elements of the secular equation are calculated and the problem is reduced to solving an equation obtained by expanding the determinant of the secular equation. The review is followed by an example of an explicit calculation performed by the author involving extraction of the roots of a fourth-order polynomial equation. The solutions give the frequency as a function of H_0 for a fixed angle θ . The numerical values obtained are compared with the parameters given by G. Kikuchi et al. (Physc. Rev., v. 109, 1399, 1958) showing good agreement. Helpful discussion with Doc. Dr. K. Leibler is acknowledged by the author. There are 4 figures, 3 tables and 17 references.

TITLE: The method of moments in the theory of electron paramagnetic resonance

SOURCE: Postepy fizyki, v. 17, no. 2, 1966, 185-204

TOPIC TAGS: electron paramagnetic resonance, method of moments, spin system, crystal absorption, absorption line, absorption probability, mathematic analysis

ABSTRACT: A review has been made of the mathematical and physical principles of the method of moments of analysis of the EPR absorption line shape and the range of its application and its usefulness. The buildup mechanism of the definite width of the EPR absorption line is discussed, and basic information on the spin system of a paramagnetic crystal in the shape of this line is given. Definitions are provided of some selected notions from the probability theory closely connected with the method of moments. Also, an exact description of the basic mathematical ideas involved in this method is given. The physical formulas giving the moments of the absorption line have been derived, and use has been made of the theories of Van Vleck [J. H. Van Vleck, Phys. Rev., 74, 1168 (1948)], Pryce and Stevens [M. H. L. Pryce, K. W. H. Stevens, Proc. Phys. Sov., A 63, 36 (1950)], Kambe and Usui [K. Kambe, T. Usui, Progr. Theor. Phys., 8, 302 (1952)] as well as that of McMillan and Opechowski [M. McMillan, Card 1/2

L 36270-66

ACC NR: AP6014317

W. Opechowski, Canad. J. Phys., 38, 1168 (1960)]. The analysis based on papers of Grant [W. J. C. Grant, Physica, 30, 1433, (1964)], Anderson and Weiss [P. W. Anderson, P. R. Weiss, Rev. Mod. Phys., 25, 269 (1953)], P. W. Anderson [J. Phys. Soc. Japan, 9, 316 (1954)], R. Kubo, [J. Phys. Soc. Japan, 9, 935 (1954)] leads to the conclusion that the method of moments, despite its many faults, is still the simplest, albeit an approximate method of analysis of the EPR absorption line shape. Orig. art. has: 3 figures and 35 formulas. [Based on author's abstract.] [AM]

TITLE: Synchronous detector with cathode followers

SOURCE: Automatizace, no. 9, 1965, 238-240

TOPIC TAGS: phase detector, cathode follower

ABSTRACT: The article describes the working principle and design of a phase sensitive (synchronous) detector which can be used in a frequency range of several cps to Mc, composed of four cathode followers. [JPRS]
